Shared institutional overview

Connected loan-book preparation for institutional funding

One evidence chain

Assurail is being developed to carry portfolio evidence through recurring preparation and financing workflows. The intended sequence is: retain source evidence; map, reconcile and freeze the loan tape; produce an unsigned touchless Initial Assessment; prepare agent-assisted workpapers for independent expert review and sign-off; match against an authorised buyer mandate; obtain human approval; progress tranches; and monitor agreed programme evidence.

Automation can identify findings and support preparation. Missing evidence remains visible. Machine matching does not approve a purchase, credit decision or drawdown. Expert sign-off, institutional authority, legal execution, custody and movement of funds remain separate responsibilities.

Planned routes and deployment choices

The planned route families are facilities, direct assignment and PTC, each in conventional or tokenised form. SQL and institutional DLT describe separate business-authority choices; they do not select a Canton or Base connection. A conventional SQL onboarding path remains part of the design. Neither token form nor ledger choice is required for every participant.

Current availability

The platform is under development. Selected components have local verification evidence, but a complete customer deployment or financing route is not accepted. This overview describes a proposed workflow for discovery; it does not claim live integrations, funding availability, certification or customer outcomes.

Scope a useful evaluation

Start with one portfolio, one funding or authorised buyer requirement and one historical reporting or closing event. Identify the source owner, operational sponsor, reviewer and security, legal and procurement decision-makers. Agree permitted sample data, useful outputs, success criteria and operating constraints before any customer-specific engagement. This preview has no contact form and no approved public contact destination.

Australia insert

Recurring loan-book readiness for warehouse funding and sale or ABS takeout

Explore one Australian originator or servicer workflow against the institution’s own reporting and lender requirements. Auto or equipment loans may be a candidate asset profile; loan, lease and other asset data require their own scope. Begin with a permitted customer or servicer export, not an assumed national loan database.

Discovery can examine one portfolio and funding or reporting event, a historical tape and reports, actual lender or trustee specifications, current exceptions, named owners, data rights, deployment constraints and measurable acceptance criteria. Public reporting specifications may inform the discussion; they do not define every lender’s requirements or grant access to a customer portfolio. Provider access, coverage, interpretation and operating costs remain to be qualified.

The intended preparation chain connects a frozen tape, unsigned Initial Assessment, agent-assisted workpapers, independent expert sign-off and institution-approved tranche or reporting progression. It does not promise financing, regulatory approval, perfected security interests or a measured saving. No Australian integration or complete route is claimed.

United States insert

Reusable preparation evidence for warehouse, forward-flow and ABS programmes

Explore one defined US originator or servicer portfolio and a specific funding or authorised buyer requirement. Auto or equipment loans may be a candidate; retail auto, dealer floorplan and leases need distinct data and policy scope. Select the actual state, asset and contract perimeter with the institution.

Discovery can examine customer-owned servicing feeds, a historical tape and report, actual eligibility and servicing rules, the institution calendar, privacy and security constraints, accepted outputs and cost evidence. Public disclosures can inform research vocabulary; they are not a live customer book, source permission, buyer mandate or legal transfer record. Public or gated investor materials have separate access and distribution limits.

The platform is under development. No complete US route, institutional deployment, sales outcome, funding commitment or legal conclusion is claimed. The actual service and compensation perimeter requires qualified review.

UAE roadmap insert

A planned UAE market and connectivity path

Customer development across Australia, the United States and the UAE is planned to start together at the halfway point of the sandbox build. That is a future build milestone; this preparation does not indicate that it has been reached or that outreach has begun.

The group direction is a planned Dubai HoldCo with country or regional operating companies. Formation, operator roles and local permissions are not established. Proposed Canton and Base connectivity sits in the existing post-sandbox programme: Month 24 central, Month 18 accelerated or Month 30 delayed from programme/model start. These are planning scenarios, not delivery commitments.

Connectivity, company formation, regulatory permissions, institutional sponsorship, customer approval and revenue are separate conditions. A network connection does not itself provide permission to operate, a sponsor, a qualified route or customer demand. No UAE sponsor, rate, volume, launch revenue or live network is claimed.
